Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes managed objects to configure and/or monitor Multicast communication over IP Virtual Private Networks (VPNs) supported by MultiProtocol Label Switching/Border Gateway Protocol (MPLS/BGP) on a Provider Edge router.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on March 21, 2019.

1. Introduction

[RFC6513], [RFC6514], and [RFC6625] specify procedures for supporting multicast in Border Gateway Protocol/MultiProtocol Label Switching (BGP/MPLS) Layer 3 (IP) Virtual Private Networks (VPNs). Throughout this document, we will use the term "Multicast VPN" (MVPN) [RFC6513] to refer to a BGP/MPLS IP VPN that supports multicast.

Provider Edge routers (PEs) attaching to a particular MVPN exchange customer multicast (C-multicast) routing information with neighboring PEs. In [RFC6513], two basic methods for exchanging C-multicast routing information are defined (1) Protocol Independent Multicast (PIM) [RFC7761] and (2) BGP.

In the rest of this document we will use the term "PIM-MVPN" to refer to the case where PIM is used for exchanging C-multicast routing information, and "BGP-MVPN" to refer to the case where BGP is used for exchanging C-multicast routing information.

This document describes managed objects to configure and/or monitor MVPNs. Most of the managed objects are common to both PIM-MVPN and BGP-MVPN, and some managed objects are BGP-MVPN specific.

1.1. Terminology

This document adopts the definitions, acronyms and mechanisms described in [RFC4364], [RFC6513], and [RFC6514]. Familiarity with Multicast, MPLS, Layer 3 (L3) VPN, MVPN concepts and/or mechanisms is
assumed. Some terms specifically related to this document are explained below.

An MVPN can be realized by using various kinds of transport mechanisms for forwarding a packet to all or a subset of PEs across service provider networks. Such transport mechanisms are referred to as provider tunnels (P-tunnels).

A "Provider Multicast Service Interface" (PMSI) [RFC6513] is a conceptual interface instantiated by a P-tunnel. A PE uses a PMSI to send customer multicast traffic to all or some PEs in the same VPN.

There are two kinds of PMSI: "Inclusive PMSI" (I-PMSI) and "Selective PMSI" (S-PMSI) [RFC6513]. An I-PMSI enables a PE attached to a particular MVPN to transmit a message to all PEs in the same MVPN. An S-PMSI enables a PE to transmit a message to a selected set of PEs in the same MVPN.

As described in [RFC4382], each PE maintains one default forwarding table and zero or more "Virtual Routing and Forwarding tables" (VRFs). Throughout this document, we will use the term "multicast VRF" (MVRF) to refer to a VRF that contains multicast routing information.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] when, and only when, they appear in all capitals, as shown here.

2. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIv2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].
This document defines BGP-MPLS-LAYER3-VPN-MULTICAST-MIB, a MIB module for monitoring and/or configuring MVPNs on PEs. This MIB module will be used in conjunction with MPLS-L3VPN-STD-MIB [RFC4382] and IPMCAST-MIB [RFC5132].

3.1. Summary of MIB Module

BGP-MPLS-LAYER3-VPN-MULTICAST-MIB provides the following functionalities.

- Monitoring attributes of MVPNs on a PE
- Configuring timers and thresholds related to an MVPN on a PE
- Notifying creation, deletion, and modification of MVRFs on a PE
- Monitoring PMSI attributes
- Monitoring statistics of advertisements exchanged by a PE
- Monitoring routing information for multicast destinations
- Monitoring next-hops for each multicast destination

To provide these functionalities, BGP-MPLS-LAYER3-VPN-MULTICAST-MIB defines following tables.

- mvpnGenericTable
  This table contains generic information about MVPNs on a PE. Each entry in this table represents an instance of an MVPN on a PE and contains generic information related to the MVPN. For each entry in this table there MUST be a corresponding VRF in MPLS-L3VPN-STD-MIB [RFC4382].

- mvpnBgpTable
  This table contains information specific to BGP-MVPNs. Each BGP-MVPN on a PE will have an entry in this table.

- mvpnPmsiTable
  This table contains managed objects representing attribute information that is common to I-PMSIs and S-PMSIs on a PE.

- mvpnSpmsiTable
This table contains managed objects representing attribute information specific to S-PMSIs. An S-PMSI represented in this table will have a corresponding entry in mvpnPmsiTable.

- **mvpnAdvtStatsTable**
  This table contains statistics pertaining to I-PMSI and S-PMSI advertisements sent/received.

- **mvpnMrouteTable**
  This table contains multicast routing information in MVRFs on a PE.

- **mvpnMrouteNextHopTable**
  This table contains information on the next-hops for routing IP multicast datagrams in MVPNs on a PE.

### 3.2. MIB Module Definitions

**BGP-MPLS-LAYER3-VPN-MULTICAST-MIB**

```snmp
DEFINITIONS ::= BEGIN

STATUS      current
DESCRIPTION
"This object describes the last action pertaining to the MVPN represented by this entry.

The enumerated action types and the corresponding descriptions are as follows:

createdMvrf:
    MVRF was created for this MVPN on the PE."
deletedMvrf:
MVRF for this MVPN was deleted from the PE.
A conceptual row in this table will never have
mvpnGenMvrfLastAction equal to deletedMvrf,
because in that case the row itself will not exist
in the table.
This value for mvpnGenMvrfLastAction is defined
solely for use in mvpnMvrfActionChange notification.

modifiedMvrfIpmsiConfig:
an I-PMSI for this MVPN was configured, deleted or
changed.

modifiedMvrfSpmsiConfig:
an S-PMSI for this MVPN was configured, deleted or
changed.

**DESCRIPTION**

"A conceptual table containing information on the next-hops for routing IP multicast datagrams. Each entry is one of a list of next-hops for a set of sources sending to a multicast group address.

```::= { mvpnObjects 8 }
mvpnMrouteNextHopEntry OBJECT-TYPE
SYNTAX MvpnMrouteNextHopEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"A conceptual row corresponding to a next-hop to which IP multicast datagrams from a set of sources to an IP multicast group address are routed.

Implementers need to be aware that if the total number of octets in mplsL3VpnVrfName, mvpnMrouteNextHopGroupAddr, mvpnMrouteNextHopSourceAddr, and mvpnMrouteNextHopAddr exceeds 111, the OIDs of column instances in this row will have more than 128 sub-identifiers and cannot be accessed using SNMPv1, SNMPv2c, or SNMPv3.

```

INDEX
```

```{| mplsL3VpnVrfName, mvpnMrouteNextHopGroupAddrType, mvpnMrouteNextHopGroupAddr, mvpnMrouteNextHopGroupPrefixLength, mvpnMrouteNextHopSourceAddrType, mvpnMrouteNextHopSourceAddr, mvpnMrouteNextHopSourcePrefixLength, mvpnMrouteNextHopIfIndex, mvpnMrouteNextHopAddrType, mvpnMrouteNextHopAddr |
```

```::= { mvpnMrouteNextHopTable 1 }

mvpnMrouteNextHopGroupAddrType OBJECT-TYPE
SYNTAX InetAddressType
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION "The InetAddressType of the mvpnMrouteNextHopGroupAddr object that follows.
"
::= { mvpnMrouteNextHopEntry 1 }

mvpnMrouteNextHopGroupAddr OBJECT-TYPE
SYNTAX InetAddress
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION "The IP multicast group address which, along with the corresponding mvpnMrouteNextHopGroupPrefixLength object, identifies destinations for which this entry contains multicast forwarding information.

This address object is only significant up to mvpnMrouteNextHopGroupPrefixLength bits. The remaining address bits MUST be set to zero.

For addresses of type ‘ipv4z’ or ‘ipv6z’, the appended zone index is significant even though it lies beyond the prefix length. The use of these address types indicate that this forwarding state applies only within the given zone. Zone index zero is not valid in this table.
"
::= { mvpnMrouteNextHopEntry 2 }

mvpnMrouteNextHopGroupPrefixLength OBJECT-TYPE
SYNTAX InetAddressPrefixLength
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION "The length in bits of the mask which, along with
the corresponding mvpnMrouteGroupAddr object, 
identifies destinations for which this entry contains 
multicast routing information.

If the corresponding InetAddressType is 'ipv4' or 'ipv4z', 
this object must be in the range 4..32. 
If the corresponding InetAddressType is 'ipv6' or 'ipv6z', 
this object must be in the range 8..128.

::= { mvpnMrouteNextHopEntry 3 }

mvpnMrouteNextHopSourceAddrType OBJECT-TYPE
SYNTAX InetAddressType
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"The InetAddressType of mvpnMrouteNextHopSourceAddrs object 
that follows.

A value of unknown(0) indicates a non-source-specific entry, 
corresponding to all sources in the group. Otherwise, the 
value MUST be the same as the value of 
mvpnMrouteNextHopGroupAddrType."

::= { mvpnMrouteNextHopEntry 4 }

mvpnMrouteNextHopSourceAddrs OBJECT-TYPE
SYNTAX InetAddress
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"The network address which, along with the 
corresponding mvpnMrouteNextHopSourcePrefixLength object, 
identifies the sources for which this entry specifies 
a next-hop.

This address object is only significant up to 
mvpnMrouteNextHopSourcePrefixLength bits. The remaining 
address bits MUST be set to zero.

For addresses of type ‘ipv4z’ or ‘ipv6z’, the appended zone 
index is significant even though it lies beyond the prefix 
length. The use of these address types indicate that this 
source address applies only within the given zone. Zone 
index zero is not valid in this table.

"

that follows.  
"  
 ::= { mvpnMrouteNextHopEntry 8 }

mvpnMrouteNextHopAddr OBJECT-TYPE  
SYNTAX     InetAddress  
MAX-ACCESS not-accessible  
STATUS     current  
DESCRIPTION  
"The address of the next-hop specific to this entry.  For  
most interfaces, this is identical to  
mvpnMrouteNextHopGroupAddr. Non-Broadcast Multi-Access  
(NBMA) interfaces, however, may have multiple next-hop  
addresses out of a single outgoing interface.  
"
mvpnMrouteNextHopState OBJECT-TYPE
SYNTAX INTEGER {
  pruned(1),
  forwarding(2)
}
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"An indication of whether the outgoing interface and next-hop represented by this entry is currently being used to forward IP datagrams.

The enumerated states and the corresponding descriptions are as follows:

  pruned : this entry is not currently being used.
  forwarding : this entry is currently being used.
"
::= { mvpnMrouteNextHopEntry 10 }

mvpnMrouteNextHopExpiryTime OBJECT-TYPE
SYNTAX TimeTicks
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The minimum amount of time remaining before this entry will be aged out. If mvpnMrouteNextHopState is pruned(1), this object represents the remaining time for the prune to expire after which the state will return to forwarding(2). If mvpnMrouteNextHopState is forwarding(2), this object indicates the time after which this entry will be removed from the table.

The value of 0 indicates that the entry is not subject to aging.
"
::= { mvpnMrouteNextHopEntry 11 }

mvpnMrouteNextHopClosestMemberHops OBJECT-TYPE
SYNTAX Unsigned32 (0..256)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The minimum number of hops between this router and any member of this IP multicast group reached via this next-hop
on the corresponding outgoing interface. Any IP multicast
datagram for the group that has a TTL (IPv4) or Hop Count
(IPv6) less than mvpnMrouteNextHopClosestMemberHops will
not be forwarded through this interface.

A value of 0 means all multicast datagrams are forwarded out
of the interface. A value of 256 means that no multicast
datagrams are forwarded out of the interface.

This is an optimization applied by multicast routing
protocols that explicitly track hop counts to downstream
listeners. Multicast protocols that are not aware of hop
counts to downstream listeners set this object to 0.

" ::= { mvpnMrouteNextHopEntry 12 }

4. Security Considerations

This MIB module contains some read-only objects that may be deemed sensitive. It also contains some read-write objects, whose setting will change the device’s MVPN related behavior. Appropriate security procedures related to SNMP in general but not specific to this MIB module need to be implemented by concerned operators.

There are a number of management objects defined in this MIB module with a MAX-ACCESS clause of read-write. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection opens devices to attack. These are the tables and objects and their sensitivity/vulnerability:

- mvpnSPTunnelLimit
The value of this object is used to control the maximum number of selective provider tunnels that a PE allows for a particular MVPN. Access to this object may be abused to impact the performance of the PE or prevent the PE from having new selective provider tunnels.

- **mvpnBgpCmcastRouteWithdrawalTimer**
  
  The value of this object is used to control the delay for the advertisement of withdrawals of C-multicast routes. Access to this object may be abused to impact the performance of a PE.

- **mvpnBgpSrcSharedTreeJoinTimer**
  
  The value of this object is used to control the delay for the advertisement of Source/Shared Tree Join C-multicast routes. Access to this object may be abused to impact the propagation of C-multicast routing information.

- **mvpnBgpMsgRateLimit**
  
  The value of this object is used to control the upper bound for the rate of BGP C-multicast routing information message exchange among PEs. Access to this object may be abused to impact the performance of the PE or disrupt the C-multicast routing information message exchange using BGP.

- **mvpnBgpMaxSpmsiAdRoutes**
  
  The value of this object is used to control the upper bound for the number of S-PMSI A-D routes. Access to this object may be abused to impact the performance of the PE or prevent the PE from receiving S-PMSI A-D routes.

- **mvpnBgpMaxSpmsiAdRouteFreq**
  
  The value of this object is used to control the upper bound for the frequency of S-PMSI A-D route generation. Access to this object may be abused to impact the performance of the PE or prevent the PE from generating new S-PMSI A-D routes.

- **mvpnBgpMaxSrcActiveAdRoutes**
  
  The value of this object is used to control the upper bound for the number of Source Active A-D routes. Access to this object may be abused to impact the performance of the PE or prevent the PE from receiving Source Active A-D routes.
o mvpnBgpMaxSrcActiveAdRouteFreq

The value of this object is used to control the upper bound for the frequency of Source Active A-D route generation. Access to this object may be abused to impact the performance of the PE or prevent the PE from generating new Source Active A-D routes.

Some of the readable objects in this MIB module (e.g., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP. These are the tables and objects and their sensitivity/vulnerability:

o The address-related objects in this MIB module may have impact on privacy and security. These objects may reveal the locations of senders and recipients.
  * mvpnPmsiTunnelPimGroupAddr
  * mvpnSpmsiCmcastGroupAddr
  * mvpnSpmsiCmcastSourceAddr
  * mvpnAdvtPeerAddr
  * mvpnMrouteCmcastGroupAddr
  * mvpnMrouteCmcastSourceAddrs
  * mvpnMrouteUpstreamNeighborAddr
  * mvpnMrouteRtAddr
  * mvpnMrouteNextHopGroupAddr
  * mvpnMrouteNextHopSourceAddrs
  * mvpnMrouteNextHopAddr

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPsec), there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.
Implementations SHOULD provide the security features described by the SNMPv3 framework (see [RFC3410]), and implementations claiming compliance to the SNMPv3 standard MUST include full support for authentication and privacy via the User-based Security Model (USM) [RFC3414] with the AES cipher algorithm [RFC3826]. Implementations MAY also provide support for the Transport Security Model (TSM) [RFC5591] in combination with a secure transport such as SSH [RFC5592] or TLS/DTLS [RFC6353].

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

5. IANA Considerations

The MIB module in this document uses the following IANA-assigned OBJECT IDENTIFIER values recorded in the SMI Numbers registry:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>OBJECT IDENTIFIER value</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvpnMIB</td>
<td>BGP-MPLS-LAYER3-VPN-MULTICAST-MIB</td>
<td>{ mib-2 AAAA }</td>
</tr>
</tbody>
</table>

Editor’s Note (to be removed prior to publication): the IANA is requested to assign a value for "AAAA" under the ‘mib-2’ subtree and to record the assignment in the SMI Numbers registry. When the assignment has been made, the RFC Editor is asked to replace "AAAA" (here and in the MIB module) with the assigned value and to remove this note.

6. Acknowledgement

An earlier draft version of this document was coauthored by Zhaohui (Jeffrey) Zhang, Saud Asif, Andy Green, Sameer Gulrajani, and Pradeep G. Jain, based on an earlier draft written by Susheela Vaidya, Thomas D. Nadeau, and Harmen Van der Linde.

This document also borrows heavily from the design and descriptions of ipMcastRouteTable and ipMcastRouteNextHopTable from IPMCAST-MIB[RFC5132].

Glenn Mansfield Keeni did the MIB Doctor review and provided valuable comments.
