A Uniform Resource Name (URN) Namespace for the CLEI Code
<draft-tesink-urn-clei-00.txt>

Status of this Memo

By submitting this Internet-Draft, each author represents that any applicable patent or other IPR claims of which he or she is aware have been or will be disclosed, and any of which he or she becomes aware will be disclosed, in accordance with Section 6 of RFC 3668.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress".

The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/1id-abstracts.txt

The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html.

This document may not be modified, and derivative works of it may not be created, except to publish it as an RFC and to translate it into languages other than English.

Abstract

This document describes a Uniform Resource Name (URN) namespace [RFC3406] that is managed by Telcordia Technologies, Inc., as the maintenance agent for ANSI T1.213 [T1.213], for the assignment of the CLEI Code, for usage within messages standardized by ANSI. The CLEI code is a globally unique, ten-character alphanumeric intelligent code assigned by Telcordia Technologies at the request of equipment suppliers. The CLEI code identifies communications equipment by specifying product type and features. There is a one-to-one relationship between a CLEI Code and supplier’s Product ID (Manufacturer’s name, part number along with it’s version number).

1. Introduction

Many circuit cards used in the global telecommunications network have a CLEI Code assigned and have a bar code or two-dimensional symbol on a label affixed to the front of that circuit card. Service providers utilize the CLEI Code to:

- Track inventory, both working and spare
- Logistics (movement of circuit cards, along with the serial number)
- Provision equipment
- Maintain asset records (accounting information)

The goal of the CLEI namespace is to ensure the stability and uniqueness of the names of various (specific) items that are used within the messages exchanged between equipment used in the global telecommunications network.

The assigned maintenance agent for the CLEI Code, Telcordia Technologies, is responsible for assigning certain equipment and other identifiers (e.g., location, manufacturer/supplier) for the telecommunications industry. The code assignment process identifies the structure and intelligence of the CLEI Code to identify the circuit card’s form, fit, functions, and features. Equipment may exist in multiple physical locations with the exact same form, fit, functions, and features and will have the same CLEI Code if their Product ID is the same.

2. Specification Template

Namespace ID:

"CLEI"

Registration Information:

Version 1
Date: 2004-12-31

Declared registrant of the namespace:

Telcordia Technologies, Inc.
Customer Support Center
8 Corporate Place

Expires 06/30/2005
Declaration of syntactic structures:

The structure of the Namespace Specific String is a flat space of 10 characters as defined in [T1.213][T1.213a].

Relevant ancillary Documentation:

[T1.213] and [T1.213a].

Identifier uniqueness considerations:

Identifiers are assigned by Telcordia URN registration that guarantees Uniqueness for items with different form, fit, functions, and features. This is simply achieved by keeping track of already assigned names and comparing all new proposed names to the database ones. If the name already exists a new one is created per the rules of the process. See [T1.213][T1.213a] for assignment examples.

Identifier persistence considerations:

The process defined by ANSI and the CLEI maintenance agent ensure the binding between the name and its resource is permanent, and that names are not reassigned.

Process of identifiers assignment:

A CLEI Code is an intelligent code that consists of 10 alphanumeric characters with 4 data elements. The first data element is considered the basic code with the first 2 characters indicating the technology or equipment type with the third and fourth characters denoting the functional sub-category. The second data element represents the features and its three characters denote functional capabilities or changes. The third data element has one character and denotes a reference to manufacturer, system ID, specification or drawing. The fourth data element consists of two characters and contains complementary data. These two characters provide a means of differentiating or providing uniqueness between the eight character CLEI Codes by identifying the manufacturing vintage of the product. Names are assigned via procedures defined in [GR485].

Process for identifier resolution:
Telcordia URNs are resolved via Telcordia resolvers run under Telcordia responsibility. For further information see www.commonlanguage.com.

Rules for lexical equivalence:

Lexical equivalence of two CLEI URN namespace specific strings is defined as an exact, case-insensitive string match. CLEI codes are assigned in a case-insensitive fashion, so that there will not be two CLEI codes that differ only in case. See [T1.213] and [T1.213a] for further information.

Conformance with URN syntax:

No special consideration.

Validation mechanism:

None specified.

Scope:

Global.

3. Examples

The following three examples are based on the examples provided in [T1.213a], and correspond with three different sets of features by three different manufacturers (Nortel Networks, Lear and Lucent Technologies) producing "D4CE" (a particular D4 channel bank type) equipment. The fourth example refers to a SONET power unit convertor of Alcatel.

URN:CLEI:D4CE18B7AA
URN:CLEI:D4CE4248AA
URN:CLEI:D4CE363PAB
URN:CLEI:SNPWBBC7AA

4. Namespace and Community Considerations

CLEI codes have historically been used in a variety of communications equipment (see examples above and [213a]). There are circumstances where entities with CLEI codes need to be managed or exposed in a larger context, such as the general Internet. In these cases, the use of the CLEI URN namespace will provide general interoperability.
benefits to the Internet at large, as well as to specific internets.

5. Security Considerations

There are no additional security considerations other than those normally associated with the use and resolution of URNs in general.

It is noted however that attempting to resolve a Telcordia URN through a resolver other than the one provided by Telcordia is not considered authoritative.

6. IANA Considerations

The IANA has registered formal URN namespace ???, to Telcordia within the IANA registry of URN NIDs.

7. Intellectual Property

The IETF takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on the IETF’s procedures with respect to rights in standards-track and standards-related documentation can be found in BCP-11. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementors or users of this specification can be obtained from the IETF Secretariat.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights which may cover technology that may be required to practice this standard. Please address the information to the IETF Executive Director.

8. Acknowledgments

The contributions of the Entity MIB Working Group members are gratefully acknowledged. Special thanks go to Mike Heard, Juergen Schoenwaelder, Dave Perkins and Dan Romascanu.

Intellectual Property Statement

The IETF takes no position regarding the validity or scope of any Intellectual Property Rights or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; nor does it represent that it has
made any independent effort to identify any such rights. Information on the procedures with respect to rights in RFC documents can be found in BCP 78 and BCP 79.

Copies of IPR disclosures made to the IETF Secretariat and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this specification can be obtained from the IETF on-line IPR repository at http://www.ietf.org/ipr.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights that may cover technology that may be required to implement this standard. Please address the information to the IETF at ietf-ipr@ietf.org.
