Definitions of Managed Objects for Parallel-printer-like Hardware Devices using SMIv2

Status of this Memo

This document specifies an IAB standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "IAB Official Protocol Standards" for the standardization state and status of this protocol. Distribution of this memo is unlimited.

1. Introduction

This memo defines an extension to the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it defines objects for the management of Parallel-printer-like devices.

2. The SNMPv2 Network Management Framework

The SNMPv2 Network Management Framework consists of four major components. They are:

   o RFC 1442 [1] which defines the SMI, the mechanisms used for describing and naming objects for the purpose of management.

   o STD 17, RFC 1213 [2] defines MIB-II, the core set of managed objects for the Internet suite of protocols.
2.1. Object Definitions

Managed objects are accessed via a virtual information store, termed
the Management Information Base or MIB. Objects in the MIB are
defined using the subset of Abstract Syntax Notation One (ASN.1)
defined in the SMI. In particular, each object object type is named
by an OBJECT IDENTIFIER, an administratively assigned name. The
object type together with an object instance serves to uniquely
identify a specific instantiation of the object. For human
convenience, we often use a textual string, termed the descriptor, to
refer to the object type.

3. Overview

The Parallel-printer-like Hardware Device MIB applies to interface
ports that would most probably support the Character MIB. The most
common example is Centronics-like printer port.

The Parallel-printer-like Hardware Device MIB is mandatory for all
systems that have such a hardware port supporting services managed
through some other MIB.

The Parallel-printer-like Hardware Port MIB includes Centronics-like
and Data-Products-like parallel physical links with a similar set of
control signals.

The MIB contains objects that relate to physical layer connections.

The MIB comprises one base object and three tables, detailed in the
following sections. The tables contain objects for ports and input
and output control signals.

3.1. Relationship to Interface MIB

The Parallel-printer-like MIB is one of many MIBs designed for
layered use as described in the Interface MIB [5]. In most
implementations where it is present, it will be in the lowest
interface sublayer, that is, the Parallel-printer-like MIB represents
the physical layer, providing service to higher layers such as the
Character MIB [6].

Although it is unlikely that a parallel printer port will actually be used as a network interface, which is the intent of the Interface MIB, the Parallel-printer-like MIB is closely connected to the Character MIB, which can share hardware interfaces with network operation, and relate to the RS-232 MIB [7].

The Interface MIB’s ifTestTable and ifRcvAddressTable are not relevant to the Parallel-printer-like MIB.

The Parallel-printer-like MIB is relevant for ifType values para(34) and perhaps others.

The Parallel-printer-like MIB requires the conformance groups ifGeneralGroup, and ifFixedLengthGroup.

Usefulness of error counters in this MIB depends on the octet counters in ifFixedLengthGroup.
